

Pre-Conditions

One Assignment todo must be created in the server.

Steps to Reproduce

- With an invalid doneStatus, i.e. anything other than a Boolean, if we send the request:

http://localhost:4567/todos?doneStatus={invalid_doneStatus}

The server answers back with response code 200 OK and response body:

```
{  
  "todos": []  
}
```

Bug Description

From the APIs documentation, it is required for the field doneStatus to be a Boolean. Anything else, even if it is applied as a query parameter, shouldn't return any result. Therefore, the fact that this request returns a positive response status is unwanted behavior. The user could be querying for an invalid doneStatus, receive an empty list of todos, and assume that the reason for this behavior is that no todos correspond to that doneStatus, while the real reason is that it is not a valid input.

Frequency

Occurs all the time.

Productivity Impact

Low

Notes

None.
