Pre-Conditions

- The API is running

Steps to Reproduce

- With an invalid active status, i.e. anything other than a Boolean, if we send the request:
http://localhost:4567/projects?active={invalid_active}
The server answers back with response code 200 OK and response body: {
"projects": []
}

Bug Description

From the APIs documentation, it is required for the field active to be a Boolean. Anything else, even if it is applied as a query parameter, shouldn't return any result. Therefore, the fact that this request returns a positive response status is unwanted behavior. The user could be querying for an invalid active, receive an empty list of projects, and assume that the reason for this behavior is that no projects correspond to that active, while the real reason is that it is not a valid input.

Frequency

Occurs all the time.

Productivity Impact

Low

Notes

None.
